Re: **Urine Amphetamine Assay**

As a result of a recent update to our assay method, the following changes have been made to our non-emergency urine drug screen for amphetamines:

Effective April 19, 2012,

- 1) The cutoff will be lowered from 1000 ng/mL to 500 ng/mL.
- 2) There will be increased cross-reactivity to MDMA and other potential ingredients of ecstasy pills, e.g. PMMA (p-methoxymethamphetamine) and related molecules.

The frequency of presumptive positive results may increase. We will still confirm positives by GC-MS
